A: I found a solution for this problem. A similar issue has been reported here: I will report back with more information if necessary. Q: C++: How to distinguish between characters in this code? So, I'm trying to build a code that has input from the console, checks for certain conditions, and then goes into a few different loops depending on what the input is. For example: INPUT: "Hi" CONDITIONS: (if than one condition). LOOPS: (Depending on the input). For the first if condition, I'm trying to determine what character the user entered. For example, if the user inputs "H" I want it to print out the letter "H". However, my if statement is unable to distinguish between different characters. I've tried two different things: char input = inputBuffer[0]; and if (input == 'H') { cout > inputBuffer; The words are then put into this vector: vector vocab; After inputBuffer, the user can type anything they want, and the program will recognize it as a word. Here's the whole program: #include using namespace std; int main() vector vocab; string inputBuffer; vector vocab2; string vocabulary; string answer; for(int i = 0; i
